

Part II: Identifying Your Product and Target Audience

A. Define your product

1. My website aims to be an improved version of the commonly used spaced repetition system (SRS)-based flashcard programs. In SRS systems, a if a user sees a new card and understands it, they can mark it as “good” to see it again in another 3 days, then if they still remember it in 3 days they see it in another week, 2 weeks, month, and so on, until they’ve seen it many times over a long stretch of time and it is ingrained in their memory. If they don’t understand the card, this cycle starts again. My website addresses a problem with SRS programs. In these programs, users input a flashcard with a sentence containing a new word they want to study. These sentences are gathered from YouTube, podcasts, books, or other media so the user studies a word in the context of their target language. However, some words have several different definitions, so studying the word in only one context is not ideal for comprehension. Also, since the user always sees the same sentence when studying a word, often they will read the first few words of the sentence and immediately remember the word without getting to the part of the sentence the word is in, and thinking about the context of the word in the sentence.
2. People make thousands of flashcards every day for these SRS programs, but they stay local to their libraries. If these cards were uploaded to a database, they could be dynamically pulled from the database when the user studies their cards, so the user could see various different sentences and see the word in a new context every time they study the card.
3. My website will be an educational website and offer this SRS system as a service.
4. My product is aimed at people who self-study languages and want a more complete and robust SRS experience. SRS programs have been standard for language learners for more than a decade, but current SRS programs are unfit to solve these problems, even if a database like I described were to be made. SRS programs are great for memorization of words, but these problems lead to a lack of deep understanding.

B. Profile of Target Audience

At its core, my target audience is anyone who self-studies or is interested in self-studying a language.

1. Who is the primary audience for your product?

- Any age range, but people who self-study languages tend to be anywhere from college-aged to people in their 60's or 70's.
- Not targeting a specific gender
- People from around the world, in urban or rural areas
- Average income would likely vary wildly, so I will try to make my site available for as little cost as possible
- People who self-study languages tend to be highly educated
- Marital and family status is unrelated
- My users would likely either be students or employed people who work fulltime
- My users would be using the web very often, and I would target people who often use desktop or laptop computers, as programs for making flashcards for SRS systems often aren't available on mobile devices or do not work well on them. However, I would want to make my flashcard studying page very mobile friendly so people can use it when they have a few moments of time during their busy day.

2.

Name	Sex	Age	Location	Occupation	Income	Web Use
Elena Marquez	Female	24	Barcelona, Spain	Graduate student (linguistics)	~€12,000/yr (stipend)	Heavy desktop use for coursework; checks phone frequently between classes
David Okafor	Male	34	Lagos, Nigeria	Software engineer (full-time)	~\$28,000/yr	Desktop during work breaks and evenings; mobile during commute
Margaret Chen	Female	61	Portland, Oregon, USA	Retired schoolteacher	~\$45,000/yr (pension)	Laptop at home most of the day; comfortable but not "power user" tech habits
Tomas Novak	Male	19	Brno, Czech Republic	Undergraduate student	~\$0 (dependent on family/part-time work)	Mobile-first, laptop for schoolwork; very online, used to fast-paced apps

3. .

Elena Marquez

Wants deeper comprehension of a language she's serious about academically. She's writing her thesis and is frustrated that her current SRS app has her "autopiloting" through familiar sentences.

***Task:** Elena signs up, imports her existing flashcard deck, and studies a set of words where the system pulls new example sentences each session instead of her old static ones.*

David Okafor

Wants an efficient way to study during short pockets of free time. He only has small windows during his commute or lunch break and needs something mobile-friendly that doesn't require deep setup each time.

Task: David opens the site on his phone during his commute, reviews his daily queue of due cards, and rates each one (good/again) without lag or awkward mobile UI.

Margaret Chen

Wants an affordable tool without steep technical setup. She self-studies Italian for fun/travel and is put off by SRS tools that feel overly technical or require managing local files.

Task: Margaret creates an account, browses or searches the database for existing community-contributed cards for common Italian vocabulary, and starts a study session without building her own deck from scratch.

Tomas Novak

Wants to contribute to and benefit from a shared card database. He already makes flashcards from anime, YouTube, and podcasts for his own study, and likes that his cards get reused dynamically instead of sitting in an isolated file.

Task: Tomas creates new flashcards from a sentence he found in a podcast, uploads them to the shared database, and later sees other users' sentences pulled in for the same word when he reviews it.

Part III: Planning and Designing Your Product Website

A. Website Requirements

1. The purpose of my website is to give users a useful SRS flashcard platform for self-studying a language. The most important action I want users to take is signing up and using the service.
2. Essential content and features for my site would be the SRS flashcard page, allowing users to upload to the flashcard database and browse the database, an initial homepage where the user signs up, and the ability to easily migrate cards to and from other popular SRS services. I would want my homepage to highlight how my SRS system would really make words stick and improve comprehension over traditional SRS services.
3. One website that inspires my design is migaku.com . Migaku is also a language learning app, and I think their homepage is both really informative and interesting visually. I also would take inspiration from apps.ankiweb.net , as this is the leading SRS app and I like how they convey information about what an SRS is. I would like to strike a balance between Migaku's fun design and the functionality and cleanness of Anki's design. I don't have preferences for colors or fonts but I would want my

site to look intriguing and grab the user's attention but still look professional.

B. Design & Prototyping

1. I would use the Agile SDLC model for this project.

a. Discovery and Planning (Week 1):

i. Finalize requirements and site map

b. Design - Sprint 0 (Week 2-3):

i. Finalize homepage wireframe, establish visual style

c. Development - Sprint 1 (Weeks 4-5):

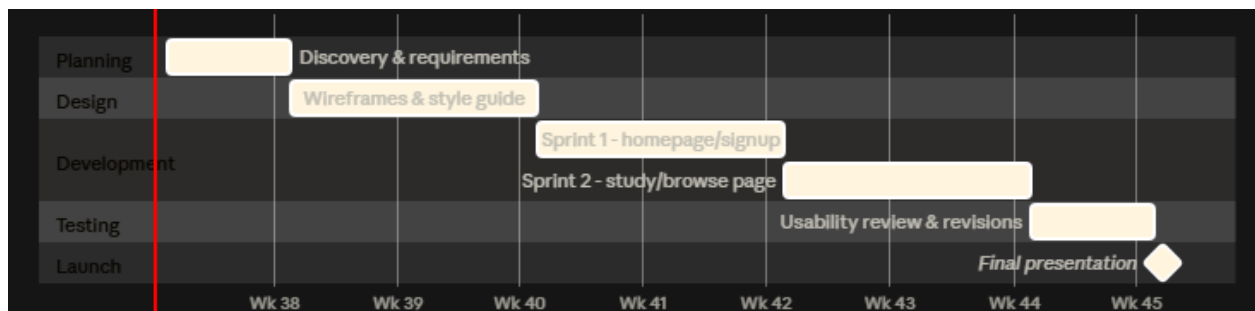

i. Build homepage and signup page

d. Development - Sprint 2 (Weeks 6-7):

i. Build flashcard study interface and card database browse / delete page

e. Testing - (Week 8)

i. Get peer review and test the site against the personas made, revise against feedback

A SMARTER SPACED REPETITION SYSTEM

Understand your words. Not just recognize them.

Spaced repetition is the most effective way to make new vocabulary stick — but most SRS apps freeze every word into a single sentence you'll eventually memorize by shape, not meaning. CardWell pulls a fresh, real example every time you review, so you actually understand the word in context.

See how it works

WHY SPACED REPETITION

The most reliable way to make a word stick

Spaced repetition has been the backbone of serious language self-study for over a decade, and for good reason — it schedules review at the exact moment you're about to forget, so the memory gets reinforced instead of relearned from scratch.

Start

Backed by memory research
Reviewing right before you'd naturally forget strengthens long-term recall far better than cramming.

Start

Efficient use of study time
You only review what's about to fade, instead of re-reading everything every day.

Start

Scales with your library
Whether you have 50 words or 5,000, the schedule adapts to keep everything fresh.

WHERE TYPICAL SRS APPS FALL SHORT

Same sentence, every time — that's a memorization shortcut, not understanding

When you always see the exact sentence you first saved, your brain learns to recognize the sentence, not the word. Many words also carry several meanings that one saved sentence can't show.

Typical SRS apps

[one static flashcard — same sentence every review]

- Same example sentence shown forever
- Easy to "autopilot" past the sentences without reading it
- Only one meaning or context per word
- Your cards stay locked in your own local library

CardWell

[three overlapping flashcards — a new sentence pulled each review]

- A new real sentence pulled from the shared database each review
- Forces you to actually process the word in context, every time
- Multiple meanings surface naturally over repeated reviews
- Your cards join a pool that helps every other learner too

HOW IT WORKS

From one sentence to a whole shared library

1

Save a card from anything
Pull a sentence with a new word from a show, podcast, or book you're already studying — just like any SRS app.

[screenshot: add-a-card form]

2

It joins the shared pool
Your sentence becomes one of many for that word, contributed by learners studying the same language.

[screenshot: shared card database / browse view]

3

Review in a new context
Every time the word comes due, CardWell pulls a different sentence — so you build real understanding, not sentence recall.

[screenshot: review screen with new sentence]

BUILT FOR SELF-DIRECTED LEARNERS

Wherever you are in your language journey

Elena, grad student
"I need to actually understand words for my thesis, not just recognize a flashcard."

David, software engineer
"I review during my commute — it has to work well on mobile with zero setup."

Margaret, retired teacher
"I don't want to build my own deck — I just want to start studying Italian."

Tomas, undergrad
"I already make cards from podcasts — I like that they help other learners too."

Start understanding your words, not just recognizing them

5. I would make sure to have high contrast, put aria-labels on icon-only control buttons, use semantic HTML throughout, have audio pronunciation on cards be optional for hearing impaired users, make interactive elements

meet a minimum touch target size for motor impaired users, and support full keyboard navigation.
